

Q1.is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security?

Ans: Yes, there is a major difference between publishing on Tableau Public and Tableau Server / Tableau Cloud, especially regarding accessibility and data security.

Feature	Tableau Public	Tableau Server / Tableau Cloud
Accessibility	Publicly accessible to anyone on the internet	Restricted access to authorized users only
Data Security	No data privacy — all dashboards and underlying data can be viewed publicly	High security with authentication, permissions, and role-based access
Best Use Case	Portfolio projects, learning, public sharing	Business, enterprise, confidential healthcare/financial data
Login Requirement	No login needed to view dashboards	Users usually need login credentials
Data Confidentiality	Not suitable for sensitive data	Suitable for confidential organizational data
Hosting	Hosted on Tableau's public platform	Hosted on private servers or secure cloud environment
User Permissions	No advanced permission control	Detailed user/group permission management
Collaboration	Limited collaboration	Enterprise-level collaboration and governance

Q2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

When publishing a dashboard in Tableau, the behavior differs significantly between a Live Connection and a Data Extract.

Aspect	Live Connection	Extract Connection
Data Source	Connects directly to the original database	Uses a snapshot/copy of the data

Aspect	Live Connection	Extract Connection
Data Refresh	Real-time or near real-time updates	Requires scheduled or manual refresh
Performance	Can be slower if database is large or network is slow	Usually faster because data is stored in optimized Tableau extract format
Dependency	Depends on database availability and connection	Works independently once extract is created
Server Load	Queries database every time users interact	Reduces load on source database
Best Use Case	Real-time monitoring dashboards	High-performance reporting and historical analysis

Effect on Data Refresh

Live Connection

- Data is always current because Tableau queries the database directly.
- Any change in the source database appears immediately in the dashboard.

Example:

If new patient records are added to the hospital database, they appear instantly in the dashboard.

Extract

- Data is static until refreshed.
- Refresh can be:
 - Manual
 - Scheduled daily/hourly
 - Incremental refresh

Example:

If the extract refreshes every night, users only see updated hospital data after the refresh completes.

Effect on Performance

Live Connection

- Performance depends on:
 - Database speed
 - Network latency
 - Query complexity
- Large datasets may slow dashboard loading.

Extract

- Faster performance because Tableau stores compressed optimized data locally/on server.
- Better for:
 - Large dashboards
 - Complex calculations
 - Faster filtering and visualization rendering

Q3.In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

In Tableau Server and Tableau Cloud, the feature that allows administrators to control who can view, interact with, or edit a published dashboard is called:

Permissions and User Roles Explanation

Administrators can assign:

- User Roles (Viewer, Explorer, Creator, Administrator)
- Permissions on projects, workbooks, dashboards, and data sources

These controls determine whether a user can:

- View dashboards
- Filter/interact with dashboards
- Download data
- Edit workbooks

- Publish new content
- Manage users and projects

Examples of Roles

Role	Access Level
Viewer	Can only view and interact with dashboards
Explorer	Can interact and perform limited editing
Creator	Can create, edit, and publish dashboards
Administrator	Full control over server/cloud environment

Q4. you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?

Ans: In Tableau Server, we could adjust the **Download Permissions** — specifically disable the:

“Download Full Data” permission or related download capabilities such as **Download Summary Data** if needed.

This allows users to:

- View and interact with the dashboard
- Use filters and visualizations

But prevents them from:

- Downloading underlying/raw data
- Exporting detailed records

Q5. Name two methods by which a Tableau dashboard can be embedded into a web page or website?

Ans: Two common methods to embed a Tableau dashboard into a web page or website are:

1. Using Embed Code (iFrame HTML Code)
 - Tableau provides an embed code that can be copied and pasted into a website’s HTML.

- This is the most common method for embedding dashboards.
- 2. Using Tableau JavaScript API / Embedding API
 - Developers can use Tableau's JavaScript API (Embedding API) to integrate dashboards with advanced interactivity and customization in web applications.

Q6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy?

Ans: When preparing a dashboard in Tableau for public sharing, two key best practices for data security and privacy are:

1. Remove or Mask Sensitive Data

Ensure that no confidential or personal information is exposed before publishing.

- Remove fields like names, phone numbers, IDs, or medical details
- Use data aggregation instead of row-level data
- Apply data masking or anonymization where necessary

2. Apply Proper Access Controls and Filters

Before publishing (especially on Tableau Server or Tableau Cloud), ensure:

- Only required data is included in extracts
- Use filters to limit exposed data
- Set correct permissions so only intended users can access sensitive views (avoid public access unless required)

Q7: After publishing a dashboard, users report a “Data not found” error.

What is the most common cause related to data source settings?

Ans: The most common cause of a “Data not found” error after publishing a dashboard in Tableau is: **Broken or missing data source connection**

What this usually means:

- The dashboard is pointing to a **local file (Excel, CSV, etc.)** that was not packaged or uploaded during publishing
- Or the **database connection path/server has changed**

- Or credentials for the data source are missing or expired

Most Common Scenario

1. Local file not included in publish

- The workbook was published without embedding or publishing the data source
- Tableau Server/Cloud cannot locate the file on the user's machine

2. Database connection issue

- Server name, IP, or database name changed
- Credentials are not saved or no longer valid

Q8: When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content?

When embedding a dashboard from Tableau into a secure internal portal, two important security measures are:

1. Authentication Integration (SSO / Trusted Login)

Implement Single Sign-On (SSO) or trusted authentication so that only verified users can access the embedded dashboard.

- Users must log in using corporate credentials (e.g., Active Directory, SAML, OAuth)
- Prevents unauthorized access even if the embed link is shared

2. Row-Level Security (Data-Level Security)

Apply Row-Level Security (RLS) to ensure users only see data relevant to their role or department.

- Different users see different data within the same dashboard
- Enforced using user filters or security tables
